

Technical Data Sheet

Material Designation

LL-13

Material Properties
Summary

- Binderless Organic Binder Double Laminated
 Acrylic Binder Laminated Hydrophobic

This is an ultra high efficiency filter medium produced from extremely fine borosilicate glass microfibers with an acrylic resin binder. This grade can be utilized as an ultrafine liquid filter by itself, or as a prefilter for increasing life in a membrane system. It is suggested for use in analytical or process biochemistry.

The base material consists of glass microfibers with 3-7% acrylic resin binder. The supporting scrims are a 0.5 oz/yd² Reemay, a high strength spun bonded polyester nonwoven.

The scrims are bonded to the glass media using a polyester hot melt which has a melting point of 325 degrees F.

Comments:

Actual filtration performance, i.e. efficiency and dust holding capacity, will vary depending upon filter design parameters and the normal variation of the media properties consistent with the specification range. We continuously strive to define our products and hence the specifications are subject to change.
